Installation

In the Modules tab of your PrestaShop back-office, you have an option to install a module from your computer. Simply select the zip file you downloaded from Addons and confirm.

Important

Before we begin, let me write a little clarification on this module. It is based on the zones of PrestaShop, but what is a zone? By default, PrestaShop has a zone by continent, so a shipping fee by continent. However, this does not match reality and we must therefore create a zone per country to apply different shipping rates. You must see these zones as delivery zones! And a country can have multiple zones thanks to this module (Corsica, French Overseas Territory, mountains, departments...).

OR

CONFIGURATION

FOLLOW THE GUIDE!

Now that your module is installed, you can create your rules. To do this, click on the Configure button of the module in the Modules page and click on the + at the top right of the module. Select the country in which you want to apply different shipping costs and

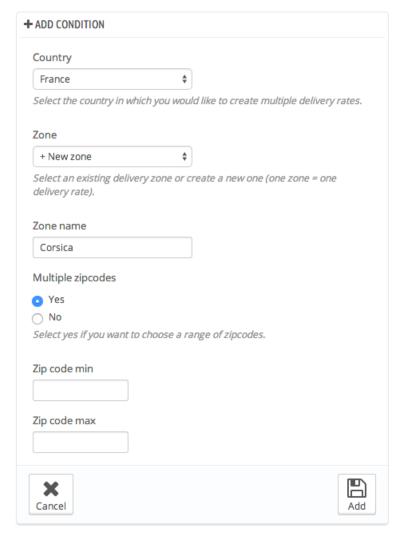

select the zone which corresponds to this new delivery zone with different shipping costs.

From PrestaShop 1.6, if a delivery zone does not exist, you can create one just by selecting New Zone in the drop down box and by naming it as you like (ex: Corsica, French Overseas Territory, Mountain...). For PrestaShop v1.4 and v1.5, you must create these zones in the tab Location > Zones.

Then select whether or not your rule concerns a single zipcode or a slice of zipcodes (ex: 75008 or 75001-75020) and enter this or these zipcode(s).

Then you must associate carriers to these new zones. Go to the Carriers tab and edit each one of your carriers to associate them to your new zones.

You then need to configure the shipping costs for each one of these zones. Depending on your version of PrestaShop, you will not find the

configuration tab in the same section. For v1.5.6.0 and above, you can set prices directly when editing the carriers. In the previous PrestaShop versions, it is in the Transport tab that it happens.

CSV IMPORT

If you want to add a large number of rules, you can use the CSV import. An example file is included in the module folder. It is composed of 4 columns: the country's <u>id</u>, the zone's <u>id</u>, the minimum zipcode and the maximum zipcode.

Setup scenarios

To help you, here are a few setup scenarios. Of course it is possible to configure the module as you wish, these are just examples.

I want to apply a different price for a specific region of a country.

By default, your country is associated with a zone (eg France). It is therefore necessary to create a rule in the module for the postal codes you want and associate it with a new zone (Corsica for example). It only remains to modify your carriers to add the delivery price for this new zone. You can repeat this operation as many times as you want, for several zones for example.

I want to allow delivery only in a specific region.

You must first create a zone in the BO of your shop that corresponds to the postal codes you wish to deliver. Then in the module, add as many rules as necessary for all these postal codes by associating them with this new zone. You will then need to modify your carriers to:

- Add a price for the new zone you just created.
- Uncheck the country's default zone

I want to offer an additional carrier in a specific region.

You must first create a zone in the BO of your shop that will correspond to the postal codes of this region with an additional carrier. Then in the module, add as many rules as necessary for all these postal codes by associating them with this new zone. You will then need to modify your carriers to:

- Associate the carrier from the country to the default zone of the country (if not already)
- Associate the carrier of the country to the new zone
- Associate the local carrier to the new zone

F.A.Q

No carrier is displayed for the zipcodes I added!

Did you added carriers to all zones? Did you added slices of price/weight for each carrier? Did you set the price of each carrier for each zone? Do not hesitate to return to the Transport tab to make sure everything is configured properly.

The prices are the same as before in the cart.

Did you try to uninstall and reinstall the module? It will surely resolve the problem.

The first zero of my zipcode disappears

Edit your country (In the countries tab in you BO) and add a zip code format.

I want to use CSV import but I have to add a min and max while I have only one ZIP code per line If you have one ZIP code by line, simply indicate this zipcode in the min and max box.

In the CSV file, there is a country ID and zone ID but I do not know what it is.

You can find the ID of your zones in the Localization > Zones page of your BO and the ID of your countries in the Localization > Countries page of your BO. This is a number (eg 12).

I want to view the shipping costs depending on the zipcode before the customer creates an account on my site.

A module is already available on your shop. On the Modules page of your BO, look for the shipping estimate module in the carrier and logistics category.

Why can't I create a rule with the same zone as the country?

In the module, the rules that you create are exceptions. When a customer wants to order something, the module will check if his zipcode matches one of your rules. If not, the default zone will be used. This is why you don't need to create a rule for the all country.

Since I configured the module, I have an error when I try to edit my carriers.

It's probably because you created a lot of zones to configure the module. This error is not related to the module directly but your server.

The easy solution is to reduce the number of zones if possible. If multiples zones have the same price, you can merge them.

The other solution is to ask your hosting provider to increase the maximal POST value on your server.
